• **Quiz #2**
  – Monday, Oct. 5
    • Beginning of the class
    • Covers: CH. 3.5 – what we finish today

• **Colloquium today**
  – Dr. Mohanty of UTA Physics department
  – Title: Optical Tweezers Based Manipulation of Materials
Optical Tweezers Based Manipulation of Materials

Samarendra K. Mohanty

Wednesday, September 30, 2009 at 4:00 pm in Room 101 SH

Abstract

Optical tweezers has had a major impact not only on biophysics and medicine, but it is also proving a very useful tool for physics and material science. In addition to remote, non-contact application of force and torque in three-dimensions that can be continuously varied unlike mechanical manipulators, tweezers can sense the force of interaction between materials, thus unraveling their mechanical properties. To advance the degree of manipulation such as rotation of materials, along with spatial structuring of intensity, other beam parameters such as phase and polarization needs to be specially configured. I will discuss these advancements in optical tweezers technology and its applications in microfluidic actuation and sorting.

Refreshments will be served in the Physics Lounge at 3:30 p.m.
Reminder: Special Project for Extra Credit

• Show that the trajectory of a projectile motion is a parabola!!
  – 20 points
  – Due: Monday, Oct. 5
  – You MUST show full details of your OWN computations to obtain any credit
    • Beyond what was covered in page 7 of Monday’s lecture note!!
We’ve been learning kinematics; describing motion without understanding what the cause of the motion is. Now we are going to learn dynamics!!

**Can someone tell me what FORCE is?**

FORCE is what causes an object to move.

The above statement is not entirely correct. Why?
Because when an object is moving with a constant velocity no force is exerted on the object!!!

**FORCEs are what cause changes to the velocity of an object!!**

What does this statement mean?
When there is force, there is change of velocity!!
What does force cause? It causes an acceleration.!!

What happens if there are several forces being exerted on an object?

Forces are vector quantities, so vector sum of all forces, the NET FORCE, determines the direction of the acceleration of the object.

\[
\text{NET} \ \text{FORCE,} \quad \mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2
\]

When the net force on an object is 0, it has constant velocity and is at its equilibrium!!
More Forces
There are various classes of forces

Contact Forces: Forces exerted by physical contact of objects

Examples of Contact Forces: Baseball hit by a bat, Car collisions

Field Forces: Forces exerted without physical contact of objects

Examples of Field Forces: Gravitational Force, Electro-magnetic force

What are possible ways to measure strength of a force?

A calibrated spring whose length changes linearly with the force exerted.

Forces are vector quantities, so the addition of multiple forces must be done following the rules of vector additions.
Newton’s First Law and Inertial Frames

Aristotle (384-322BC): A natural state of a body is rest. Thus force is required to move an object. To move faster, one needs larger forces.

Galileo’s statement on natural states of matter: Any velocity once imparted to a moving body will be rigidly maintained as long as the external causes of retardation are removed!!

Galileo’s statement is formulated by Newton into the 1st law of motion (Law of Inertia): In the absence of external forces, an object at rest remains at rest and an object in motion continues in motion with a constant velocity.

What does this statement tell us?
• When no net force is exerted on an object, the acceleration of the object is 0.
• Any isolated object, the object that do not interact with its surroundings, is either at rest or moving at a constant velocity.
• Objects would like to keep its current state of motion, as long as there are no net force that interferes with the motion. This tendency is called the Inertia.

A frame of reference that is moving at a constant velocity is called the Inertial Frame

Is a frame of reference with an acceleration an Inertial Frame? NO!
Mass

**Mass:** *A measure of the inertia of a body or quantity of matter*

- Independent of the object’s surroundings: The same no matter where you go.
- Independent of the method of measurement: The same no matter how you measure it.

---

**The heavier the object, the bigger the inertia!!**

*It is harder to make changes of motion of a heavier object than a lighter one.*

The same forces applied to two different masses result in different acceleration depending on the mass.

\[
\frac{m_1}{m_2} \equiv \frac{a_2}{a_1}
\]

---

**Note that the mass and the weight of an object are two different quantities!!**

Weight of an object is the magnitude of the gravitational force exerted on the object. Not an inherent property of an object!!!

Weight will change if you measure on the Earth or on the moon but the mass won’t!!

**Unit of mass?**

\[ \text{kg} \]
Newton’s Second Law of Motion

The acceleration of an object is directly proportional to the net force exerted on it and is inversely proportional to the object’s mass.

How do we write the above statement in a mathematical expression?

\[ \vec{a} = \sum_i \vec{F}_i \]

From this we obtain

\[ \sum_i \vec{F}_i = ma \]

Newton’s 2\textsuperscript{nd} Law of Motion

Since it’s a vector expression, each component must also satisfy:

\[ \sum_i F_{ix} = ma_x \]
\[ \sum_i F_{iy} = ma_y \]
\[ \sum_i F_{iz} = ma_z \]
Unit of the Force

From the vector expression in the previous page, what do you conclude the dimension and the unit of the force are?

\[ \sum_i \vec{F}_i = m \vec{a} \]

The dimension of force is \([m][a] = [M][LT^{-2}]\)

The unit of force in SI is \([\text{Force}] = [m][a] = [M][LT^{-2}] = (\text{kg}) \left( \frac{m}{s^2} \right) = \text{kg} \cdot m/s^2\)

For ease of use, we define a new derived unit called, Newton (N)

\[ 1N \equiv 1\text{kg} \cdot m/s^2 \approx \frac{1}{4} \text{lbs} \]
A **free-body-diagram** is a diagram that represents the object and the forces that act on it.

Opposing force = 560 N
Example 4.3

What constant net force is required to bring a 1500kg car to rest from a speed of 100km/h within a distance of 55m?

\[ v_0 = 100\text{ km/h} \quad v = 0 \]

\[ x = 0 \quad x = 55\text{ m} \]

What do we need to know to figure out the force? Acceleration!!

What are given? Initial speed: \( v_{xi} = 100\text{ km/h} = 28\text{ m/s} \)
Final speed: \( v_{xf} = 0\text{ m/s} \)
Displacement: \( \Delta x = x_f - x_i = 55\text{ m} \)

This is a one dimensional motion. Which kinetic formula do we use to find acceleration?

\[ v_{xf}^2 = v_{xi}^2 + 2a_x(x_f - x_i) \]

Acceleration

Thus, the force needed to stop the car is

\[ F_x = ma_x = 1500\text{ kg} \times (-7.1\text{ m/s}^2) = -1.1 \times 10^4\text{ N} \]

\[ \Delta x = x_f - x_i = \frac{v_{xf}^2 - v_{xi}^2}{2a_x} = \frac{m(v_{xf}^2 - v_{xi}^2)}{2ma_x} = \frac{m(v_{xf}^2 - v_{xi}^2)}{2F_x} \]

• Linearly proportional to the mass of the car
• Squarely proportional to the speed of the car
• Inversely proportional to the force by the brake
Ex. Pushing a stalled car

What is the net force in this example?

\[ F = 275 \text{ N} + 395 \text{ N} - 560 \text{ N} = +110 \text{ N} \]

Which direction? The +x axis of the coordinate system.
What is the acceleration the car receives?

If the mass of the car is 1850 kg then, by Newton’s second law, the acceleration is

\[ \sum \vec{F} = m \vec{a} \]

Since the motion is in 1 dimension

\[ \sum F = ma \]

Now we solve this equation for \( a \)

\[ a = \frac{\sum F}{m} = \frac{+110 \text{ N}}{1850 \text{ kg}} = +0.059 \text{ m/s}^2 \]
Vector Nature of the Force

The direction of force and acceleration vectors can be taken into account by using $x$ and $y$ components.

$$\sum \vec{F} = m\vec{a}$$

is equivalent to

$$\sum F_y = ma_y \quad \sum F_x = ma_x$$
Ex. Stranded man on a raft

A man is stranded on a raft (mass of man and raft = 1300kg)m as shown in the figure. By paddling, he causes an average force $P$ of 17N to be applied to the raft in a direction due east (the $+x$ direction). The wind also exerts a force $A$ on the raft. This force has a magnitude of 15N and points $67^\circ$ north of east. Ignoring any resistance from the water, find the $x$ and $y$ components of the rafts acceleration.
First, let’s compute the net force on the raft as follows:

<table>
<thead>
<tr>
<th>Force</th>
<th>x component</th>
<th>y component</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\vec{P}$</td>
<td>+17 N</td>
<td>0 N</td>
</tr>
<tr>
<td>$\vec{A}$</td>
<td>+(15N)$\cos67^\circ$</td>
<td>+(15N)$\sin67^\circ$</td>
</tr>
<tr>
<td>$\vec{F} = \vec{P} + \vec{A}$</td>
<td>+17+15$\cos67^\circ$=+23(N)</td>
<td>+17+15$\sin67^\circ$=+14(N)</td>
</tr>
</tbody>
</table>
Now compute the acceleration components in $x$ and $y$ directions!!

\[
\vec{a} = a_x \hat{i} + a_y \hat{j} = (0.018 \hat{i} + 0.011 \hat{j}) \text{ m/s}^2
\]
Example for Newton’s 2\textsuperscript{nd} Law of Motion

Determine the magnitude and direction of the acceleration of the puck whose mass is 0.30kg and is being pulled by two forces, $F_1$ and $F_2$, as shown in the picture, whose magnitudes of the forces are 8.0 N and 5.0 N, respectively.

### Components of $F_1$
- $F_{1x} = |F_1| \cos \theta_1 = 8.0 \times \cos (60^\circ) = 4.0 N$
- $F_{1y} = |F_1| \sin \theta_1 = 8.0 \times \sin (60^\circ) = 6.9 N$

### Components of $F_2$
- $F_{2x} = |F_2| \cos \theta_2 = 5.0 \times \cos (-20^\circ) = 4.7 N$
- $F_{2y} = |F_2| \sin \theta_2 = 5.0 \times \sin (-20^\circ) = -1.7 N$

### Components of total force $F$
- $F_x = F_{1x} + F_{2x} = 4.0 + 4.7 = 8.7 N = ma_x$
- $F_y = F_{1y} + F_{2y} = 6.9 - 1.7 = 5.2 N = ma_y$

### Magnitude and direction of acceleration $a$
- $a_x = \frac{F_x}{m} = \frac{8.7}{0.3} = 29 m/s^2$
- $a_y = \frac{F_y}{m} = \frac{5.2}{0.3} = 17 m/s^2$
- $|\vec{a}| = \sqrt{(a_x)^2 + (a_y)^2} = \sqrt{(29)^2 + (17)^2} = 34 m/s^2$
- $\theta = \tan^{-1}\left(\frac{a_y}{a_x}\right) = \tan^{-1}\left(\frac{17}{29}\right) = 30^\circ$

### Acceleration Vector $\vec{a}$
- $\vec{a} = a_x \hat{i} + a_y \hat{j} = \left(29 \hat{i} + 17 \hat{j}\right)m/s^2$
